fxsa.me

Hello. The following are highlights of the indicator.

installation

- indicator to move the file to the appropriate folder of the terminal
- Click the file of the terminal in the top menu - open data catalog
- Next, open the folder MQI4
- Next folder indicators
- Move the file to display
- Restarting the terminal
- Indicator appears in the Navigator (Ctrl + N) Now you can move the chart and change the setting display (input parameters)

The indicator does not show arrows on the story (it does not delete or redraw the arrows that appeared later), so do not be alarmed that the chart that does not appear.

As for the levels, they appear together with a signal, so you can see where the candle, and where the level. Thus, it is accentuated levels at a particular signal, filter it, and this approach is more specifies the trade.

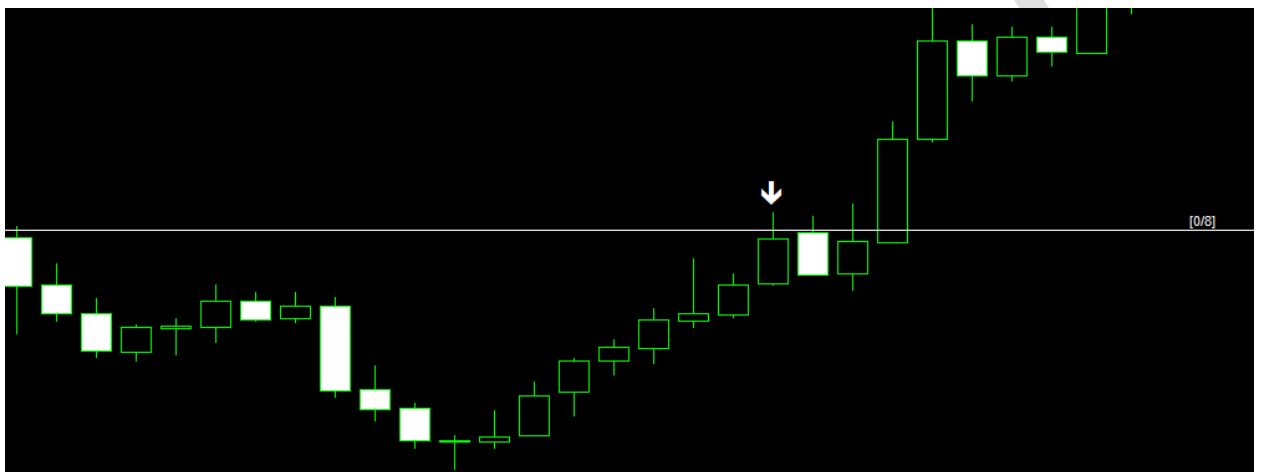

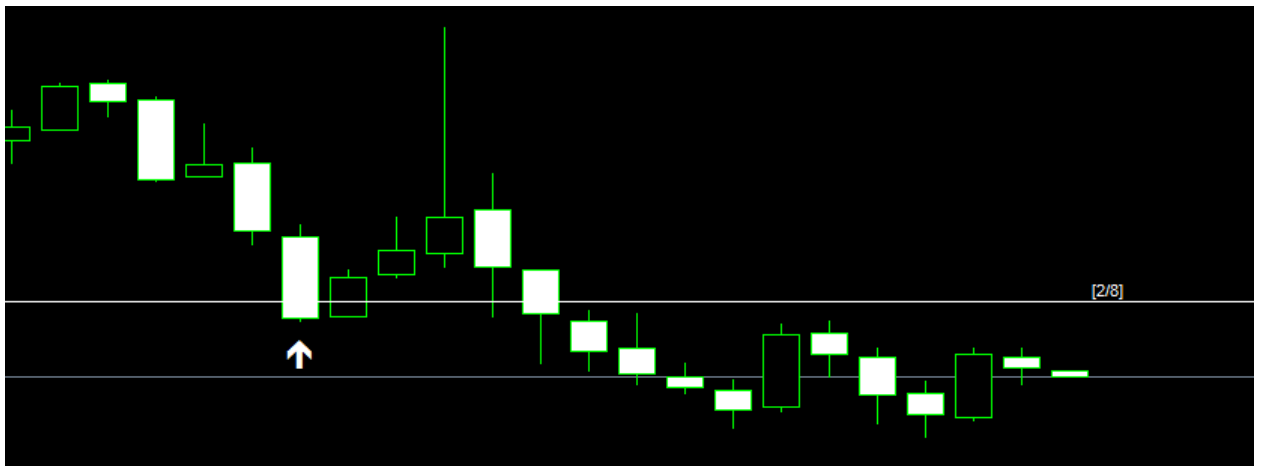

**The indicator was created in the first place for trading in binary options with a term of expiration of one candle**

The indicator consists of two parts, the first is the signal and an arrow, the second is dynamic levels (level Murray, white line), static (channel dotted)

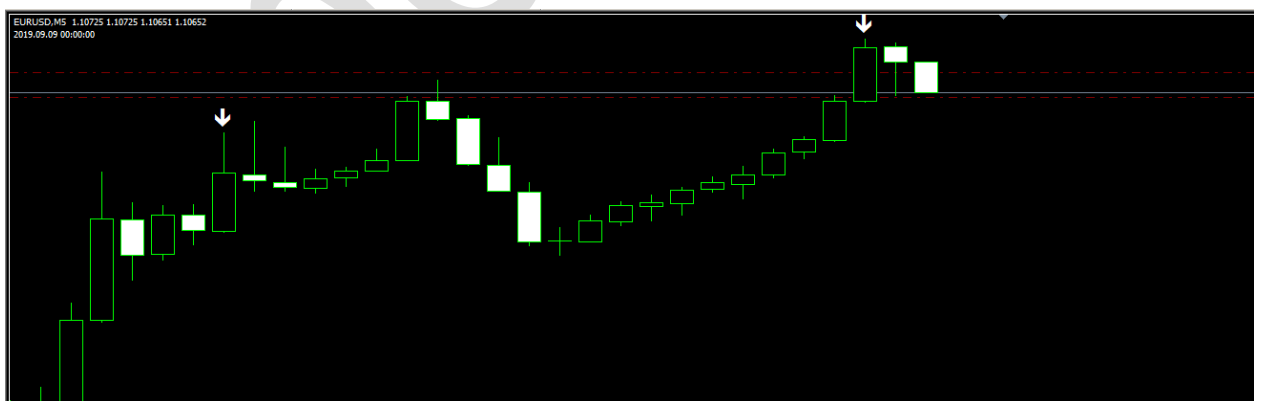

Enter into a transaction worth if the candle

1. Do not have too little body, it is best if the candle is more than the previous candle lately
2. Do not have long shadows, the upper and lower at the same time (in other words, the candle should not be like a top)
3. Candle broken or deflected by Murray level

fxsa.me

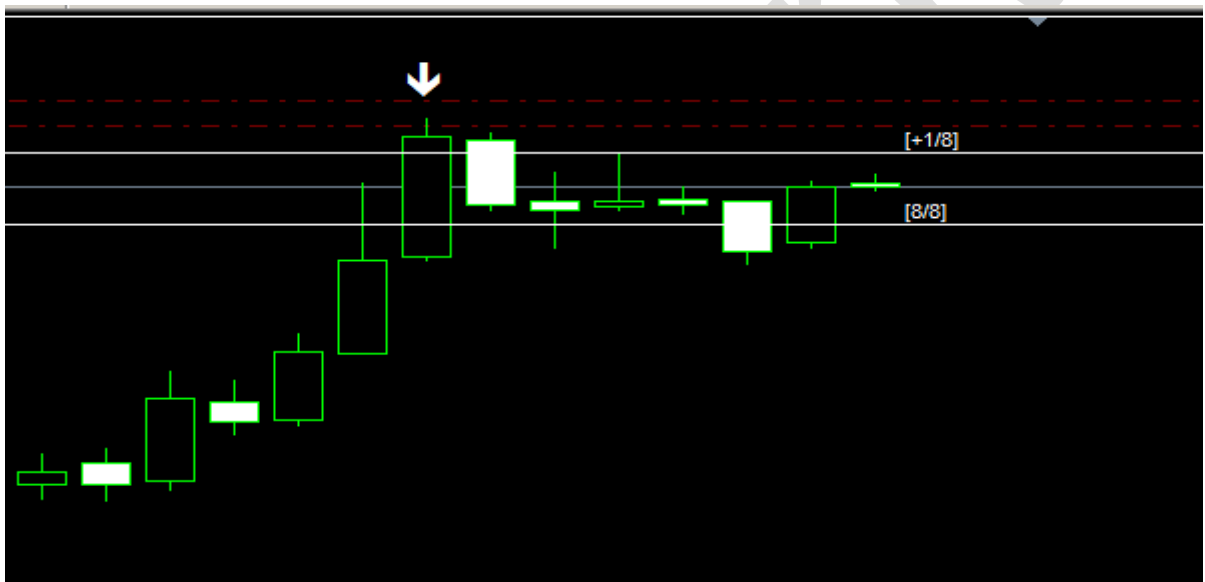

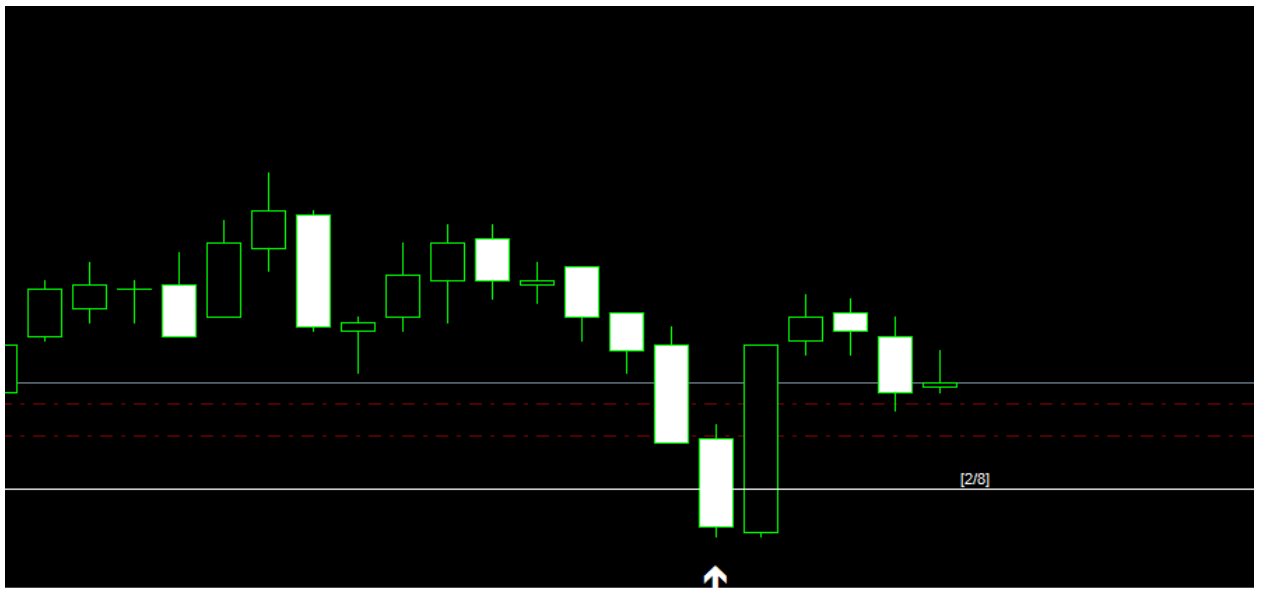

4. The price has broken or deflected from a static level

5. Murray several levels or multiple levels Murray + static level, also subject to the rules above (breakdown or rebound)

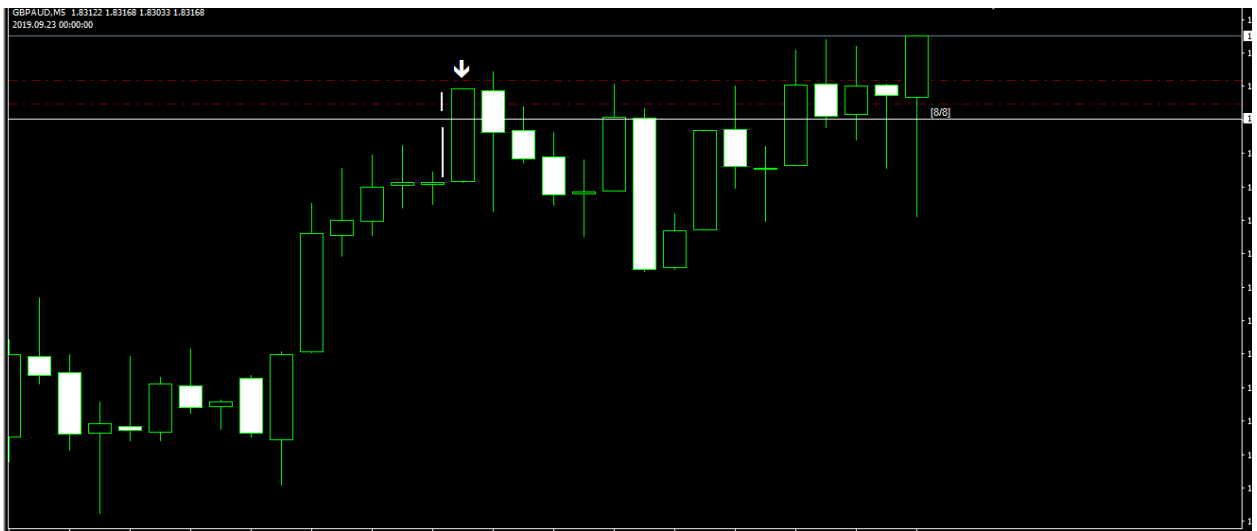

fxsa.me

If you are a supporter of the more rare and accurate signal, you can choose only those signals when

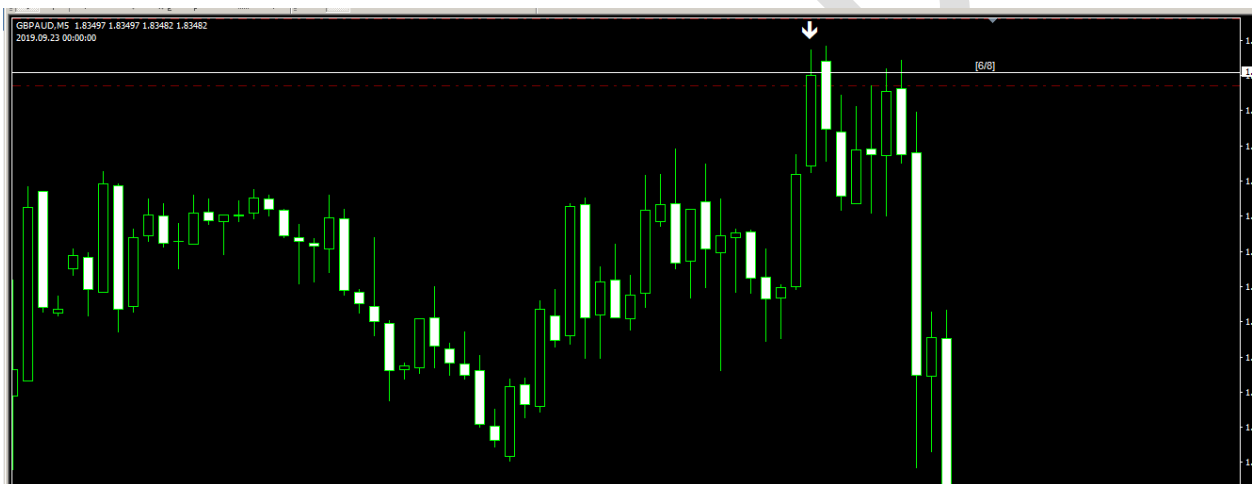

- a) Full-bodied candle without shadow
- b) The candle pierced the level of Murray (static on all do not pay attention) and with less than half.

fxsa.me

(Example pierced Murray level less than half the usual level do not look, and the candle without long shadows)

c) Or rebounded, but with a little shadow, and the level is close to the body of the candle.

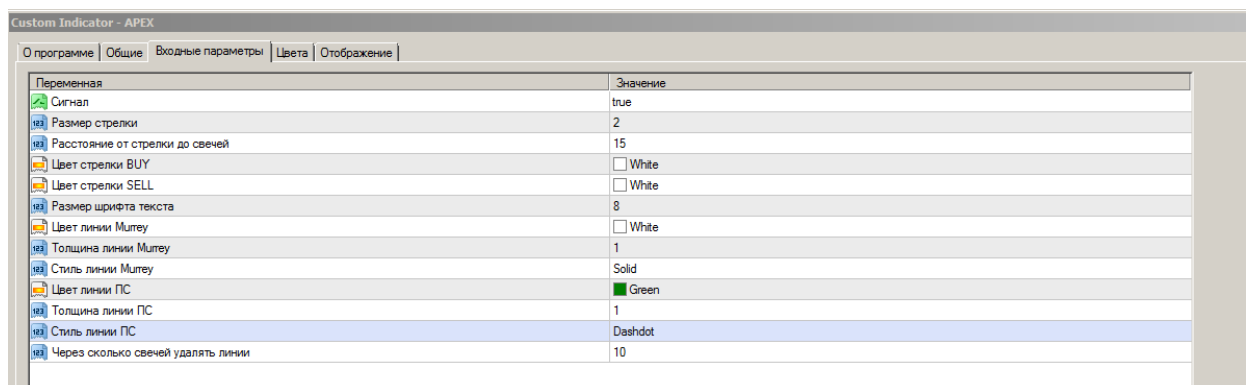

If the signal appears before, then we are waiting for the candle to close and enter, if the signal came after the close of the candle, in which the arrow is entering immediately. S / arrow / level look at the time frame in which you receive a signal on its operating timeframe (as the hand made graphics, to or when not removed it simultaneously appears on all time, but watch it only on your timeframe, in total trade is conducted on one-half your work.)

fxsa.me

In addition, we look at things like: news outlet, the change of the trading sessions, the strong trend, candles too long shadows.

The indicator can be placed on any timeframe and asset better trading time after about noon until late evening (European, American Session)

Will run in the same settings for:

As you can see the settings are quite simple, does not require any intervention required, and they are mainly focused on the styles. Pay attention to the last one - "how many candles to delete the line." The fact is that when the signal is given, there are levels from which we enter into a particular transaction, that is, on every level of your signal. And that they are in the future you do not interfere, you can configure them to automatically delete it after so many candles.

That's all. If you have questions, write to [support@agatafx.pw](mailto:support@agatafx.pw)
