

+++ The Uncle Scanner for Agimat 20018+++

version 1.2 Supporter Edition

Hello Traders!

I made some videos how to install, setup and use the Uncle Scanner.

Video with the new features in Version 1.2

<https://www.youtube.com/watch?v=vvAy8LI582A>

UPDATE THE SCANNER

If you have an older version of the scanner you only have to delete or override the old .ex4 file of the scanner, then restart MT4 or refresh the Expert Advisors. If you want a total clean version, please delete or override the template file as well

FIRST TIME Installation & Configuration

Part 1 <https://www.youtube.com/watch?v=k-FHyqywvVY>

Part 2 <https://www.youtube.com/watch?v=tcvkv2CwQSo>

Part 3 <https://www.youtube.com/watch?v=Sj2fPpjtie8>

Part 4 <https://www.youtube.com/watch?v=mFsHjZvvLsE>

INSTALLING & STARTING THE SCANNER

<https://www.youtube.com/watch?v=k-FHyqywvVY>

If you already know how to install templates and EAs please watch at least the last minutes of the video, where I explain how to set the timeframes for the scanner and how to scan more than one timeframe at the same time.

You need the original Agimat 2018 version with a licence otherwise the scanner does not work

You must install the scanner on the same Metatrader where Agimat is already installed

You must use the Scanner template for loading the scanner. You can do this with any currency pair you want. Regardless what pair you choose the scanner will always scan all the pairs from the settings menu.

If you put the scanner on H1 it scans all the pairs for the H1-Timeframe, if you put the EA on H4 it scans for H4 setups, and so on. You can choose any timeframe you want.

THE SCANNER SETUPS

<https://www.youtube.com/watch?v=tcvkv2CwQSo>

Please change in setup menu the name of the pairs to the names your broker uses (For example EURUSDecn). Otherwise you will not receive any signals. By default it works for Pepperstone, IC Markets and many other brokers. This setup is case sensitive, the names must 100% match with the names your broker uses! After you changed it, save the Scanner Template, otherwise you must change the names everytime you load the scanner!

If you want less than 30 pairs for the scanning process, delete the pairs you don't want and put a 0 instead

You can add up to 30 pairs. You can use any pair your broker offers.

THE BUILT IN PAIR SWITCHER

If you want to use the pair switcher from the scanner you must set the original Agimat template as default template in your Metatrader -> I explain it in this video

<https://www.youtube.com/watch?v=Sj2fPpjtie8>

SETUP MENU

If you want to receive alerts by mail you can set this to true but your Metatrader needs to set up before (You can find an explanation here: <https://www.forexboat.com/mt4-email-alert/>)

If you want to receive push notifications on your mobile phone you can set this to true but you need to download the free Metatrader app first and connect the Metatrader with it.
(<https://www.tradingheroes.com/how-to-get-forex-trading-alerts-on-your-mobile-metatrader-4-push-notifications/>)

If you need help with this, I can make a video how to setup MT4 correctly for mail alerts and push notifications

USING THE SCANNER

<https://www.youtube.com/watch?v=mFsHjZvvLsE> (with a live example)

If you scan on higher timeframes, please don't expect signals every minute. A setup on H1 occurs in best case once a day on every pair (or less!).

If you first run the scanner it scans for an ongoing setup which is still valid. After that it rescans after a new candle has been fully established. This is how Uncle Lee trades - only after a candle close. Example: If you scan the H1 after the initial scanning process you can only get new signals when a new hour starts (because this is when a new candle has been formed). Most time of the day you will see a blank screen if you scan the higher timeframes. You can expect often a bunch of signals at the start of London, NY and during the end of Asia session.

The scanner does NOT check the Maxwell. It only confirms that the three major criterias for a Uncle Setups met together. You must check if the trade is good enough to take or not!!! Some people use other conformations than the Maxwell, this is why I don't use the Maxwell status for confirmation.

If a setup is not valid anymore (means a new candle has been established) the EA will delete the Signal from the dashboard. If you don't want that, you change this in the settings. But the EA will delete older signals in anyways if on the dashboard is no more space for new signals. If you use this not recommended setting be careful not to take old signals!!!

OUTLOOK

In a next version I will add Shan's higher timeframe confirmation. You then can see for every signal if it is in alignment with the H4.

Happy trading!
Roland

If someone finds the scanner helpful and wants to support my work, you can use my paypal address to donate money oberasbacher@googlemail.com

+++ Release Informations

Beta 1.01	<p>Bug fixed on pair switcher for different pair names</p> <p>Added Timeframe Information on upper right corner</p>
Beta 1.02	<p>Fixed wrong button connection for AUDJPY-Button</p> <p>Fixed wrong Bid price information on mail alerts</p>
Version 1.1	<p>Added confirmation timeframe</p> <p>Button design section added</p> <p>Sell/Buy signals only possible</p> <p>Match timeframe mode added</p> <p>Fixed a bug which showed not more than 13 signals a day</p> <p>Pairswitcher shows now Agimat trend of confirmation timeframe</p>
Version 1.15	<p>Fixed a major bug in timeframe matchmode</p> <p>Added option to set fontsize of pairnames for the buttons</p> <p>Added option to change colour of dashboard signals</p> <p>Added conf-timeframe information to all alerts</p> <p>Dashboard signals are now in green (for buy) and red (for sell)</p>
Version 1.2	<p>Added Maxwell prediction</p> <p>New dashboard interface</p> <p>New filters to filter out signals</p>
